

The operating system for litigation-heavy law firms.

Run matters, research, drafting, hearings, court-order compliance, contracts, outside counsel, billing, and review queues from one matter-native workspace.

Citation-grounded AI

Review-first workflows

India-ready billing

The data says litigation work is already at system scale.

Indian court data shows the operational load. AI economics shows the capacity upside. The law-firm buyer needs both in one controlled workflow.

5.00Cr

district pending cases

NJDG shows 5,00,47,690
pending District Court cases.

12.69L

listed today

NJDG shows 12,68,577 District
Court cases listed today.

64.56L

High Court pending

HC NJDG shows 64,55,550
pending High Court cases.

240h

AI time upside

TR benchmark: nearly 240
hours per professional/year.

The sales question: can the firm turn live court pressure, matter work, review, and billing into one controlled system?

Sources: NJDG District Court and HC dashboards accessed 2026-07-10; Thomson Reuters Future of Professionals Report 2025.

Firms lose margin when matter truth is scattered.

The problem is not lack of tools. It is that the tools do not share the same legal and operational truth.

■ State gets rebuilt

Associates reconstruct the matter every time they move between email, folders, research, drafting, and billing.

■ Partner review slows

The draft, authorities, last order, facts, and missing evidence rarely sit together when the reviewer opens the file.

■ Deadlines become brittle

Court orders, listings, compliance directions, and ownership get lost between diaries, chats, and spreadsheets.

■ Revenue arrives late

Time, invoice, recovery, write-off, and spend data sit outside the matter, so profitability is discovered after the work.

Operational load signal: NJDG District Court dashboard shows 48,52,203 cases above 10 years, 15,27,325 undated cases, and 44,14,807 excessive dated cases.

CaseOps makes the matter the operating system.

Every workflow attaches back to one matter graph, so legal context, review state, team boundaries, and commercial context are shared.

One record. Many workflows. Shared accountability.

It combines practice management, legal intelligence, and trust controls.

Most tools solve one part of the law firm stack. CaseOps is designed to run the work end to end.

Matter OS

Matters, parties, documents, hearings, drafts, tasks, billing, audit, and status live in one operating cockpit.

Legal AI inside the workflow

Research, drafting, hearing prep, recommendations, and contract extraction are grounded in sources and matter facts.

Trust plane

Tenant isolation, ethical walls, model policy, review gates, audit exports, and provider readiness labels are designed in from day one.

Sales translation: fewer fragmented subscriptions, less partner review friction, cleaner proof for clients and IT.

Every workflow starts from the live matter record.

A matter is not just metadata. It is the operating surface where lawyers see what is true, what is pending, and what needs review.

Matter cockpit contains

- Parties, forum, stage, owner, team scope
- Documents, orders, pleadings, evidence
- Hearings, next date, provenance, manual locks
- Drafts, review state, citations, versions
- Tasks, deadlines, compliance directions
- Time, invoices, payments, write-offs, audit

Partner payoff

The reviewer opens one matter and sees the draft, citations, last order, missing facts, authority context, billing state, and audit trail without asking three people for status.

Less status chasing. Better legal review.

Research is grounded before it is generative.

CaseOps does not treat legal research as a chatbot prompt. It retrieves, filters, cites, and keeps uncertainty visible.

1

Ask the issue

Phrase the fact pattern or legal question in natural language.

2

Retrieve sources

Search statutes, judgments, matter documents, and internal precedents.

3

Cite the answer

Return authorities, snippets, assumptions, contrary signals, and gaps.

4

Save to matter

Attach the note, shortlist, or authority card to the matter for reuse.

Rule: weak evidence returns uncertainty or refusal. The system should never invent a case, statute, fact, or quote.

First drafts get faster, review gets stricter.

The product promise is not unverifiable speed. It is reviewable legal work grounded in matter facts, authorities, and court-specific requirements.

■ Input

Matter facts, confirmed extraction fields, statute sections, orders, documents, and internal templates.

■ Generate

Draft types include litigation templates, Supreme Court escalation pack, court-format profiles, and filing bundles.

■ Verify

Inline citations, placeholders for unknown facts, statute checks, citation coverage, and version comparison.

■ Review

Submit, request changes, approve, finalize, export DOCX/PDF, and preserve audit on every state transition.

What changes in the firm

Associates spend less time assembling first drafts and more time improving arguments. Partners review the chain of facts and sources directly in the matter.

Tomorrow's hearing pack should assemble itself, then wait for lawyer review.

The morning of a listing should not be spent reconstructing chronology, directions, last order context, or oral points.

■ Chronology

Events assembled from filings, orders, communications, and matter activity.

■ Last order

Source-backed directions and pending compliance items surfaced for review.

■ Bench context

Court and judge context shown with limitations, not outcome forecasting.

Hearing pack output

- issues and questions for oral hearing
- authority cards and contrary signals
- affidavit gaps and missing documents
- review-required directions before activation
- post-hearing follow-up tasks

Court updates become controlled work, not inbox noise.

India-specific court operations are where CaseOps feels less like generic practice software and more like a legal operating system.

■ Tracked case refresh

Opt-in CNR/case-number tracking with provider-gated refresh, safe skipped states, and admin visibility.

■ Court-order compliance

Orders generate source-backed, review-required compliance items before tasks or deadlines activate.

■ Next-hearing provenance

Manual locks, accepted suggestions, source labels, and history prevent silent overwrites.

■ Cause-list PDFs

Date-wise court-style PDFs with filters, missing-field warnings, row count, checksum, and download audit.

Internal product boundary: no captcha bypass, no unapproved live provider calls, external notifications remain provider-gated.

Transactional work stays connected to the litigation and client record.

Contract review is not a separate island: obligations, deviations, and risk signals should feed the same matter graph.

Clause extraction

Parties, obligations, dates, notices, indemnities, payment terms, dispute resolution, and source snippets for review.

Playbook compare

Tenant playbooks flag matched, missing, deviation, and needs-review positions without exposing raw contract payloads in audit metadata.

Obligations

Contract duties become matter-linked tasks and reporting items, so legal ops and litigation context stay synchronized.

Clients and outside counsel get scoped windows, not messy forwards.

Law firms can collaborate without giving everyone the same system-level access.

■ **Outside counsel portal**

Magic-link access to assigned matters, work-product upload, invoice submission, and time entries.

■ **Client portal and KYC**

Matter-scoped client view with communications, hearings, KYC states, and audit on every transition.

■ **Unified timeline**

Emails, notes, platform messages, and review events attach to the matter rather than disappearing into inboxes.

■ **Calendar candidates**

Imported invite metadata can become internal calendar items after explicit review, not silent automation.

Revenue discipline belongs inside the matter.

Matter billing is separate from CaseOps SaaS billing. The firm should see legal work and commercial state in one place.

GST/TDS

India-ready invoice fields and tax splits

PDFs

Server-rendered invoices and statements

Double billing guard

Time entries already invoiced cannot be billed again

UAT gated

Pine Labs live payments remain disabled until signoff

The AI posture is review-first by design.

CaseOps sells speed through control, not speed instead of control.

■ Citation grounding

Substantive answers and drafts are tied to named sources where available.

■ Refusal over fabrication

Missing facts become placeholders. Weak evidence becomes uncertainty, not false confidence.

■ Tenant model policy

Allowed providers, budgets, quotas, and usage lineage can be governed per tenant.

■ ModelRun audit

Provider, model, tokens, latency, status, refusal, and action metadata are recorded without raw payload leakage.

Sources: CaseOps README and public law-firms page; Thomson Reuters 2025 notes AI ROI depends on strategy, leadership, operations, and individual adoption.

Built for partner, IT, and client scrutiny.

A law-firm pilot must earn trust from the managing partner, IT admin, compliance lead, and client relationship owner.

■ **Tenant isolation**

Every core record, storage object, retrieval path, and audit event is scoped by tenant.

■ **Audit by default**

Draft approvals, compliance review, exports, billing actions, and admin changes are recorded.

■ **Upload controls**

File extension, content-type, magic-byte, and secure download protections are implemented foundations.

■ **Ethical walls**

Matter-level walls override broad role access and are audited when access is denied.

■ **Data governance**

No cross-tenant training by default; raw prompts, raw LLM responses, secrets, and provider payloads stay out of tenant views.

The pitch is stronger because the boundaries are explicit.

Law firms do not need magical claims. They need to know what is live, what is review-first, and what remains gated.

Status	What to say in sales	Examples
Live	Safe to demo as product capability.	Matter cockpit, drafting studio, invoice PDFs, audit export, cause-list preview/PDF, client/outside-counsel portal foundations.
Review-first	Automation proposes. Lawyers confirm.	Court-order compliance, extracted drafting facts, legal updates, recommendations, hearing packs.
Provider-gated	Enabled only after lawful source, credentials, consent, and UAT proof.	Court adapters, case tracking providers, Outlook/Google, external email/SMS/WhatsApp delivery, Pine Labs live payments.
Planned	Roadmap, not live-pilot promise.	Full OIDC/SAML SSO, SCIM, private enterprise deployment, autonomous scoped-agent execution.

Use product evidence the firm can verify.

CaseOps is strongest when it sells workflow breadth, review gates, auditability, and explicit readiness labels. Unsourced performance claims do not belong in the pitch.

31

draft templates

Drafting Studio pack including Supreme Court escalation templates.

7 acts

statute catalog

BNSS, BNS, BSA, CrPC, IPC, Constitution, and NI Act.

91

statute sections

Public product copy says sections carry bare text and source links.

4

narrow agents today

Cause-list watcher, corpus ingest, structured extraction, document retry.

250-2,500

tracked-case quotas

Law-firm plans scale from Starter to Pro tracked-case entitlements.

16:00-18:00

refresh window

Tracked-case refresh runs in the Asia/Kolkata daily window.

Sources: CaseOps public law-firms page, README, GBA guide, and billing explainer reviewed 2026-07-10.

The ROI case should be validated in a live pilot.

Use external research as a benchmark, then let the firm's own matters prove time saved, review quality, deadline confidence, and billing discipline.

Measured pilot model

- 15 lawyers in one practice group
- 30 minutes reclaimed per lawyer per workday
- 220 working days per year
- 1,650 hours/year in pilot capacity
- Compare with 240 hours/year external benchmark

What the firm gets back

- More matters handled without immediate headcount expansion
- Faster first-draft and hearing-pack cycles
- Partner review focused on judgment, not assembly
- Better recoveries through matter-linked billing state
- Cleaner audit evidence for clients and governance

Model is an assumption to validate during pilot; external benchmark from Thomson Reuters Future of Professionals 2025.

Six weeks to a credible law-firm pilot.

A strong pilot proves one practice group's real workflows before the firm makes a broader platform decision.

0

Scope

Pick one practice group, 10-25 active matters, roles, and success measures.

1

Setup

Workspace, users, sample matters, security policy, AI budgets, templates, and billing profile.

2-

3

Matter work

Upload documents, run drafting, research, hearing packs, and cause-list/court-order flows.

4-

5

Governance

Review audit export, access walls, billing state, readiness labels, and objections.

6

Decision

Score adoption, time saved, risk controls, data migration, and rollout plan.

Pilot success measures: draft cycle time, hearing-pack completeness, citation review quality, deadline confidence, partner adoption, and billing-state visibility.

Each stakeholder has a reason to say yes.

The deck should speak to the whole decision room, not just the technology sponsor.

■ **Managing partner**

More capacity, stronger review, better visibility, partner-led governance.

■ **Litigation partner**

Faster prep, cleaner chronology, better first drafts, fewer missed directions.

■ **Associates**

Less repetitive assembly, better research trail, clearer review expectations.

■ **Firm admin and finance**

Billing profile, invoice PDFs, recoveries, spend, audit, export readiness.

■ **IT and security**

Tenant scoping, ethical walls, model policy, provider-gated controls, no cross-tenant training.

■ **Clients**

Faster turnaround, traceable work, cleaner reporting, scoped portal access.

CaseOps is not another point tool.

It can sit alongside research databases, document storage, and office suites while becoming the system that turns those inputs into legal work.

Category	What it does well	What it misses	CaseOps answer
Generic AI chat	Fast text generation	No matter graph, citations, access control, or workflow state	Use AI inside reviewable legal workflows.
Practice management	Tasks, calendar, contacts, billing	Weak legal intelligence and AI governance	Put matter ops and legal work on one record.
Research platform	Corpus and authority discovery	Not the firm's operating system	Bring citations into drafts, recommendations, and hearings.
Contract tools	Clause review and playbooks	Often isolated from litigation and portfolio ops	Attach obligations and deviations to matter context.
DMS and email	Storage and communications	No structured legal decision layer	Convert documents and messages into reviewable work.

Pilot pricing lets firms prove value before firmwide rollout.

The catalog can support simple law-firm entry and a path to enterprise deployment discussions.

Firm Starter INR 5,999/mo 5 users, 300 matters, 250 tracked cases, 25 GB storage	Firm Growth INR 19,999/mo 15 users, 10 viewers, 1,500 matters, 1,000 tracked cases	Firm Pro INR 49,999/mo 50 users, 50 viewers, 5,000 matters, API access, SSO readiness	Enterprise Custom Unlimited/contract-defined, private deployment planning, security review
--	--	---	--

Recommended sales motion: start with one practice group, lock pilot terms, then expand by matter volume, users, storage, AI credits, and security posture.

Source: CaseOps billing catalog documentation reviewed 2026-07-10. Prices are pilot/catalog terms, subject to contract.

The hard questions have answers.

Law-firm buyers will ask about accuracy, adoption, confidentiality, integrations, migration, and money. Answer directly.

■ Will AI hallucinate?

Grounding, refusal states, verified citations, placeholders, and lawyer approval are built into substantive workflows.

■ Is our data safe?

Tenant isolation, ethical walls, no cross-tenant training by default, redacted audit, and provider-gated integrations.

■ Will lawyers adopt it?

Start from matter workflows they already run: drafts, hearings, research, cause lists, billing, and review.

■ Can it integrate?

Use bounded provider workflows first. Enable Outlook, Google, court sources, and payments only after readiness and UAT.

■ How hard is migration?

Pilot with 10-25 matters, dry-run bulk import, Drive metadata planning, and scoped document upload.

■ Will it hurt billing?

Reclaimed time can become capacity, alternative fees, faster turnaround, better collections, and cleaner realization.

Start with one practice group and ten real matters.

The cleanest close is a focused pilot: small enough to run quickly, real enough to prove whether CaseOps changes daily work.

The ask

A 45-minute founder-led walkthrough, followed by a pilot workspace seeded with the firm's sample matters, templates, users, and access model.

Pilot inputs

- 10-25 active matters
- 4-6 lawyers plus admin
- priority courts and practice areas
- templates and billing profile
- security and readiness review
